Ledger (/construct2017/agenda/session/163820)
3:45pm - 4:05pm Jan 31

Blockchain applications live in their own digital realm, totally orthogonal to the physical world. In order to exist and solve real life problems, they must interface with human operators or machines through atomic transactions and contract function calls. As much as a blockchain is intrinsically secure thanks to its consensus based mechanism, the global security

architecture ultimately depends on the reliability of the inputs fed to the system. If transactions generation is compromised, or if a data source is corrupted, the whole security model collapses.

Ethereum Classic
(/construct2017/agenda/session/163821)
4:10pm - 4:30pm Jan 31

Ethereum Classic was birthed as a direct result of The DAO hack in July 2016 after an unknown hacker was able to move a significant portion of the $150 million worth of Ether invested into The DAO tokens. When Ethereum's hard fork was enacted to revert stolen funds back to The DAO and then the original token investors, a group opposed to the decision, believing instead that actions resulting from application code present from the crowdsale should not warrant a protocol level fork, continued to mine blocks on the original non-forked Ethereum blockchain now referred to as Ethereum Classic or ETC. In the following months, the hashing power and price of ETC reached over 20% of that of ETH, and several exchanges, miners,
